

Short presentation of the 2CC sticker

The 2CC product is a colorimetric sticker indicating the presence of CO₂ in breathing gases of patients. It is a ~1.6*1.6 cm large partly transparent sticker provided with adhesive so that it can be attached inside transparent host products like breathing masks, HME: s, bacterial filters or plastic couplings through which the breathing gases of a patient pass. See the enclosed photos

The printing text can be easily adapted to the specifications of customers and a number of alternative hues are available for the text and the frames.

Specially desired sizes can be developed with a lead-time of approximately 6 – 12 months.

The 2CC is similar to (substantial equivalence) and has the same color indicator technology as the Bregas AB device C-it that received a 510(k) approval from the FDA, K000520 (2000). This technology has been used in CO₂ color indicator devices on the market since then, for instance K050066 of Marquest Medical Products Inc. (2005) and more recently in the Seebreath AB Capnodura units K112840 (2012) sold by Medline.
